Overview

The current rating is calculated from the conductor cross-sectional area, material (copper or aluminium), and maximum temperature rise per IEC 61439-1 (typically 70K above 35 degrees C ambient for bare copper). The Busbar Current is calculated using the following formula: Where, I_{bb} – Busbar Current (A) w – Width (in millimeters) t – Thickness (in millimeters) MF – Material Carry Capacity Factor (amps/mm²) To find the busbar current, multiply the width & thickness together, then multiply by the material. The busbar sizing calculator determines the required busbar dimensions based on the continuous current rating, short circuit withstand, and thermal limits for switchgear assemblies. You can choose the type of busbar, either aluminium or copper or galvanized bars or iron busbar or silver in the results. It applies directly to switchgear, distribution panels, power substations, data. The busbar current (I_{bb}) calculation is given by the formula: $I_{bb} = w \times t \times MF$ where: (MF) is the material carry capacity factor in amps/mm². Material factors vary by material, common ones include: 1. For a copper busbar with a width of 50 mm, a.
