

Does relay protection include transformer substations

Overview

In HV (High Voltage) and MV (Medium Voltage) substations, relay protection safeguards critical assets such as transformers, circuit breakers, and lines. Protect and control grounded and ungrounded, single- and double-wye capacitor bank configurations. Provide bus differential and breaker failure protection, automation, and control. Generator protection covers: phase-to-phase short circuits in stator windings, stator ground faults, inter-turn short circuits in stator windings, external short circuits, symmetrical overload, stator overvoltage, single- and double-point grounding in the excitation circuit, and loss of excitation. ABB's transformer protection relays are used for protection, control, measurement and supervision of power transformers, unit and step-up transformers, including power generator-transformer blocks in utility and industry power distribution networks. Transformers 5 MVA and below are almost always protected by fuses. As experts in substation engineering and design, we understand that a substation is only as reliable as the systems that protect it. In that sense, they are very.
