

Enable portal server on access switch

Overview

To configure captive portal on your switch: To quickly configure captive portal on the switch after completing the tasks in the Requirements section, copy the following commands and paste them into the switch terminal window: set access radius-server . To configure captive portal on your switch: To quickly configure captive portal on the switch after completing the tasks in the Requirements section, copy the following commands and paste them into the switch terminal window: set access radius-server . A built-in Portal server is an embedded entity on an access device, that is, the access device functions as the Portal server. After receiving a Portal authentication request from a client, the Portal server initiates a Portal authentication request carrying the user name and password to the access. The topology contains an EX Series access switch connected to the authentication server on port ge-0/0/10. Interface ge-0/0/1 connects to the conference room host. Configure the devices to meet the following requirements: · The AC provides direct portal authentication for the client. A RADIUS server acts as the authentication/accounting server.
