

Grounding of Lebanon AC distribution box

Overview

Attach a ground wire from one of the threaded studs (A) at the bottom of the housing, to the mounting plate (B). This helps to reduce the potential difference that exists between conductive parts and the earth. Equipment Protection: Grounding protects substation. The grounding system provides a low-impedance path for fault current and limits the voltage rise on the normally non-current-carrying metallic components of the electrical distribution system. Each DISTRIBUTION BOX and controller must be grounded. 26 mm² (10 AWG) ground wire must be used, and in all other markets a 6 mm² must be used. Whether you're a seasoned pro or just starting out, this comprehensive guide will give you practical. Any engineer dealing with power supply networks needs to understand the basic principles of grounding system design and its role in ensuring safety of equipment and personnel.
