

How can energy and the internet be combined

Overview

The energy internet is a multi-network system that uses the internet and other information technology to power systems. The internet consumes extraordinary amounts of energy. Yet, their benefits are not evenly distributed. The digital divide and. The first Industrial Revolution was driven by coal and steam power, combined with the printing press; the second was fueled by centralized electricity and the oil-powered internal combustion engine, together with the telephone, radio, and television. It integrates distributed renewable sources, storage, EVs, and smart buildings, allowing them to exchange data and power in real-time to enhance. Also, the Energy Internet can be interpreted as an integrated energy supply system, i., the electric power system tightly coupled with other energy networks such as the natural gas network, the traffic network and the information network [7, 8], as shown in Fig.
