

# How to assemble fiber optic arrays

## Overview

The article provides a brief overview of the fabrication process of optical fiber arrays, a core component in high-speed optical modules, discussing their structure, manufacturing steps, quality control, common issues, and potential solutions.

Aligning optical fiber. Fiber arrays (or fiber-optic arrays or fiber array units) are one- or two-dimensional arrays of optical fibers. In fiber handling and array assembly, precise alignment is essential to minimize optical losses and ensure long-term performance, supporting the growing need for compact photonic. The processing process of fiber array is that the exposed optical fiber part with the optical fiber coating removed is placed in the V-shaped groove, pressed by the pressed part, and bonded by adhesive, and finally, the surface is ground and polished to the required precision. PI's modular hardware and ACS EtherCAT-based controller architecture allow OEMs to construct really.
