

How to ground the shielding layer of the optical cable entering the terminal box

Overview

With single-ended grounding, it is usually better to ground the cable shield at the source end, because that is the reference for the signal voltage. However, if the signal source is floating, grounding the shield at the load end is preferable. But how you ground your cables can make the difference between a reliable, noise-free network and one plagued with mysterious issues. Let's take a closer look at why grounding. Low-frequency cable shield grounding At low frequencies the primary purpose of a shielded cable is to prevent electric-field coupling from 50/60 Hz power lines. No practical shield provides magnetic-field protection at low frequency. These standards help engineers design systems that resist interference and avoid. How to Ground a Shielded Cable?

is crucial for maintaining signal integrity and preventing electromagnetic interference (EMI); the key is to connect the cable's shield to a grounding point at one or both ends, depending on the application, to effectively drain unwanted noise.
