

Multimode fiber performance

Overview

Multimode Fiber (MMF) has a core diameter, typically 50–100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at the 850 nm and 1300 nm wavelength and is used for short distance interconnections. Multimode Fiber (MMF) has a core diameter, typically 50–100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at the 850 nm and 1300 nm wavelength and is used for short distance interconnections. Multimode fiber (MMF) continues to play a critical role in today's high-bandwidth, short-range optical networks. This AE Note classifies multimode fiber according to the following broad categories. All multimode fibers utilizing the above nomenclature should. Multimode fiber works well for short to medium distances, providing scalable capacity and cost-effective deployment for data centers, office buildings, and campuses.
