

Outdoor cabinet ventilation design

Overview

Ventilation: Proper ventilation is crucial in humid climates to prevent moisture build-up inside the cabinet. This helps keep the interior dry and fresh, protecting stored items from potential damage. The cabinet is built against a wall, constructed from a non-combustible material. If you're looking to design your outdoor kitchen as an island, this can be accommodated as a custom design, as it requires additional panels along the back of the island to protect it from any combustible materials (including the island itself). These are large, overhead ventilation systems designed to pull hot air away from your island. They will sit directly above the grill. Vent hoods also have baffle filters, which capture the grease coming off of your food. Use this table to find the right CFM for your grill: Downdraft systems are perfect when you need to save space or keep things looking neat. Pop-up. In our guide below, we give you the lowdown on the different types of outdoor kitchen ventilation hood models you can get and how to add one to your space.
