

Paired with a gigabit optical module

Overview

The SFP port is a built-in optical port of a Gigabit Ethernet switch, so it cannot be directly connected with a twisted pair or a jumper. It needs to be connected to an optical module first, and then it can be transmitted with an optical fiber patch cord. Different types of optical modules have different performance parameters such as speed. These bandwidths are pushing traditional copper interconnects required to reach the PHY layer and an optical module to their limit. In this article, I'll run over the important guidelines for working with an optical PHY that would be found in a modern network switch, the layout topology, and how to. A gigabit SFP module is a hot-pluggable transceiver designed to deliver 1Gbps Ethernet connectivity over fiber or copper, and it remains one of the most widely deployed networking components in enterprise, campus, and industrial networks today. The PoE switch with SFP can be linked together by using the fiber optical cable.
