

Switch and Router Aggregation

Overview

An aggregation switch is a network device that consolidates traffic from multiple access switches, wireless access points, or other edge devices and forwards it to core switches or routers. Aggregation services in routers and edge platforms help enable network edge routing. By bundling multiple network connections into a single high-bandwidth link, aggregation switches help. The expected growth of Gigabit and multigigabit services requires operators to architect network access scalability upfront. For this reason, we've delivered a data center-influenced standalone OLT architecture paired with non-blocking leaf-spine fabric and aggregation switching. It helps in managing higher traffic loads between switches. 3ad link aggregation enables you to group Ethernet interfaces to form a single link layer interface, also known as a link aggregation group (LAG) or bundle.
